# Walkthrough

## Client side

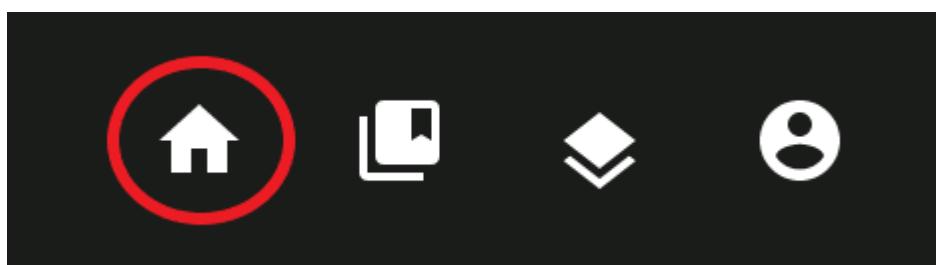

After creating an account the user will be prompted to the dashboard where posts from relevant professionals are displayed.

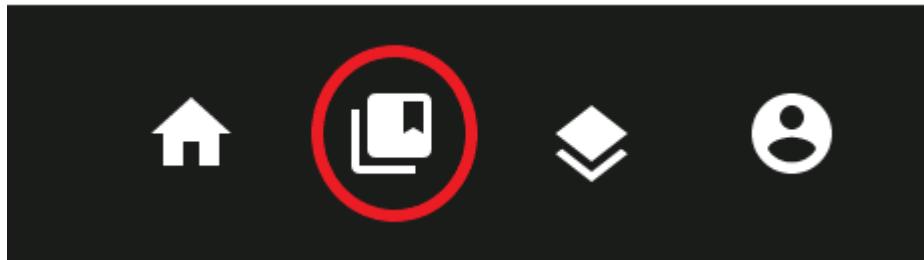

In the dashboard the user can search for professionals and tags. When searching for users a drop down with profiles will be displayed and accessing them will redirect the user to the professional's profile. Searching for the tags will filter posts so the dashboard will only show posts related to those tags.

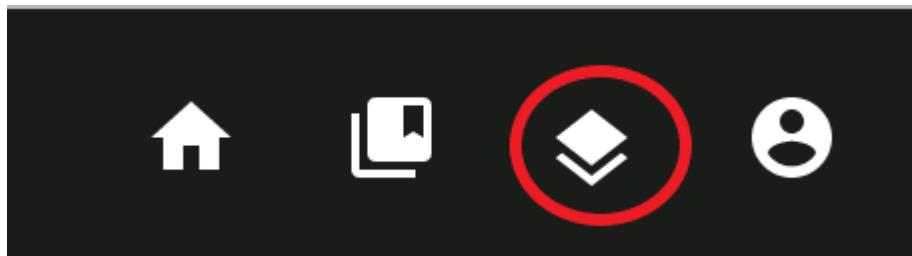

The logo button will redirect the user back to the dashboard from any page of the app.

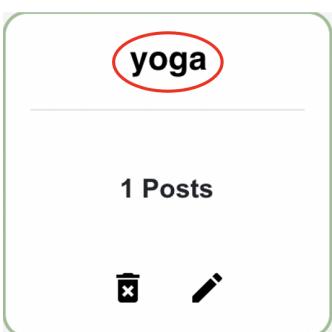

The home button will redirect the user to the HomePage where goals can be created, edited and tracked. Suggestions of services provided by professionals will also be displayed.

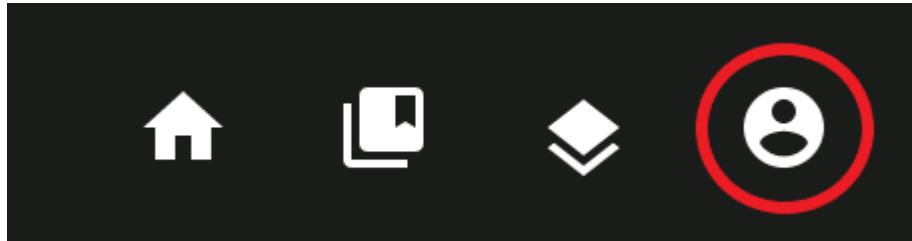

The second button will open a page where the purchased services are shown, such that the users can see the premium content.

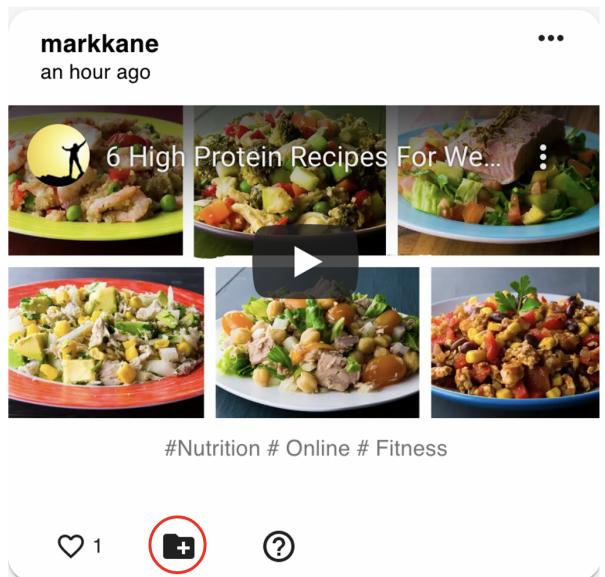

This button will open the buckets' page, where buckets can be created and edited.

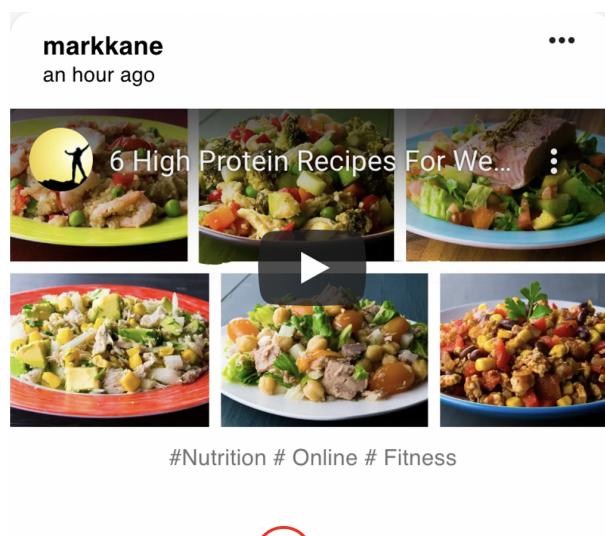

By clicking the name of the bucket the user will be shown the posts saved inside the bucket.

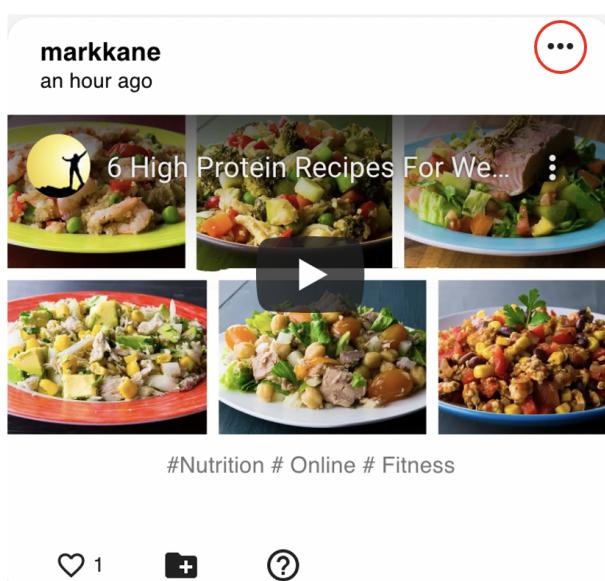

The last button redirects the users to their profiles.

By clicking on this button, the user can save this post to either a preexisting bucket or create a new one.

When clicked, this button expands the post, so the users can see more information about it such as its title, tags, message and creator.

This button offers the option of reporting a post. The users need to provide the reason why they reported the post.

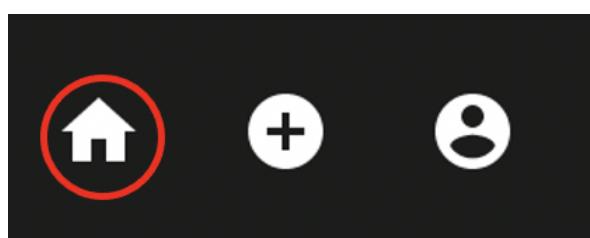

## Service Providers' side

After creating an account the user will be prompted to the dashboard where posts from other professionals are displayed.

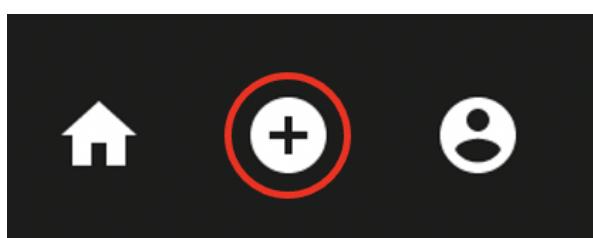

In the dashboard professionals can search for tags. This action will filter the posts previously shown, only the ones related to the tag will be displayed.

The logo button will redirect the user back to the dashboard from any page of the app.

The home button redirects the provider to a page where they can only see the posts created by them.

By clicking this button, the user can create a new post.

**Create Post**

---

Title \*

Message \*

Tags (comma separated) \*

**Post Type:**

Photo Post  
 Video Post  
 Audio Post  
 Embedded Link Post  
 Facebook Post

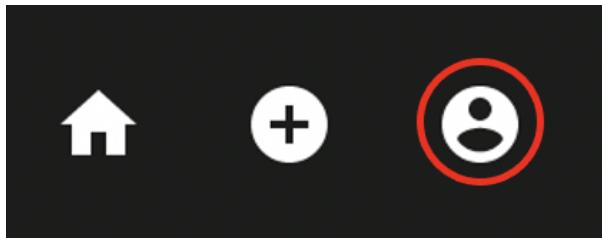

Upload Link

**SUBMIT**      **CLEAR**

When creating the Embedded link Posts the Service Providers must use embedded links meant for iFrame. For example: Embed Link -> iFrame

When creating the FaceBook Post, the URL to be uploaded must be taken using the following steps:

1. Click on the rightmost icon(3 dots) and select the **Embed** Option
2. On being directed to Embedded Posts page, scroll down and click on **Get Code**
3. Select IFrame and copy the url within the src attribute

This button redirects the user to their profile.
